

5G, coronavirus and contagious superstition | The Guardian

By Tim Adams

April 27, 2020

There have not been too many encouraging graph lines in recent weeks. One that does offer a breath of optimism, however, is the slight downward curve that implies one of the most toxic trends of our times - the anti-vaxx movement - might just be in retreat. The shift is incremental, but in a UK-wide survey in mid-March, 7% of people insisted they would refuse to have a coronavirus vaccine if one were available. By early April, with hospital wards and mortuaries filling up, that number had dropped to 5%. Perhaps vaccine conspiracy cannot bear too much pandemic reality.

As with the strategies against the virus itself, however, the response to any likely “cure” seems likely to vary from country to country. A similar survey in France, also conducted by the London-based [Vaccine Confidence Project](#), suggested 18% of people would refuse a vaccine, while in a poll in New York, the city worst affected by the pandemic, 29% insisted they would not consent, a number that may render any programme ineffective.
