

Even Some Health Care Workers Refuse To Get The COVID-19 Vaccine | NPR

By Deepa Shivaram

September 20, 2021

As new data shows 1 in 500 Americans has died from COVID-19 and the delta variant continues to surge across the country, the next challenge many health care leaders face is within their own staffs: the 27% of U.S. health care workers who have not been vaccinated against the disease as of July, according to a study by The COVID States Project.

On top of that, other research shows that since the vaccine first became available to health care workers in December 2020, the rate of vaccination among nurses and nursing home aides has been lower than that of physicians. This may be of particular concern because nurses and aides have such frequent and close contact with patients.

Data shows health care workers have gotten the COVID-19 vaccine at a higher rate than the general population: 73% versus 64% of non-health care workers. And many may assume that people who work in health care industry are more enthusiastic about the vaccine and less apprehensive.

But there are limits, says David Lazer of Northeastern University, the lead researcher on The COVID States Project report. The attitudes of health care workers toward the COVID-19 vaccine essentially mirror the rest of the country — with those living in rural areas, are Republican and have less education and income more likely to be vaccine-resistant.
