

Political ideology predicts susceptibility to believing fake news about the novel coronavirus pandemic | PsyPost

By Eric W. Dolan

August 4, 2020

Political conservatism was associated with heightened susceptibility to believing fake news about COVID-19 in the early stages of the outbreak in the United States, according to new research published in Social Psychological and Personality Science. The study provides preliminary evidence that support for President Donald Trump plays a role in viewing COVID-19 as less of a personal threat and less severe in general.
