

Pornhub Launches Its Own VPN | The Verge

By Shannon Liao

May 25, 2018

Pornhub is [launching its own VPN service today](#) with free and unlimited bandwidth. The VPN is supposed to help users avoid ISP throttling and geographic limitations. It's also designed to let users transmit data anonymously without saving or collecting any of that data.

To get started, you download the VPNHUB app on your device and then tap setup. On the iPhone running iOS 11.3.1 that I tested it with, the app prompted me to create a VPN in settings. You might see an error message at first, but despite that, the app's main page, which shows a swirling lock symbol, will whirl a bit and then activate your VPN. Then, to check if the VPN is working, go to a site like [WhatIsMyIPAddress.com](#) and check your IP address. If it's working, it should list your location as a generic city and have swapped out your usual IP address.

Pornhub's VP Corey Price said in a statement to *The Verge* that incognito browsers don't offer enough cover from "prying eyes," especially if users are still browsing on public Wi-Fi networks, so the VPN will provide an added layer of security and privacy.
